

Zadatak: Pomoću utjecajne funkcije  $\eta_R$  dobivene metodom pomaka odredite iznos reakcije  $R$ , ( $K = 160 \text{ kN}$ ,  $EI = 20250 \text{ kNm}^2$ ).

nepoznanica:  $\varphi_2$

$$k_{21} = k_{23} = \frac{1}{L}$$

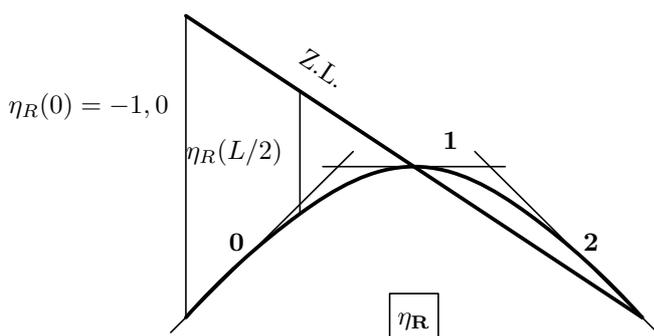

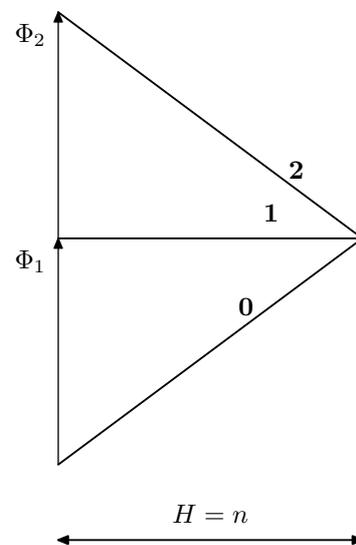

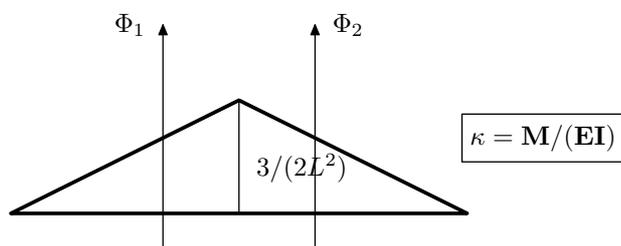

$$\text{momenti upetosti: } \overline{M}_{21} = 3 \frac{EI}{L} \frac{(0-1)}{L} = -\frac{3EI}{L^2}$$

$$M_{21} = 3k_{21}\varphi_2 + \overline{M}_{21} = \frac{3}{L}\varphi_2 - \frac{3EI}{L^2}$$

$$M_{23} = 3k_{23}\varphi_2 = \frac{3}{L}\varphi_2$$

$$\sum_i M_{2i} = 0 \Rightarrow \frac{6}{L}\varphi_2 = \frac{3EI}{L^2} \Rightarrow \varphi_2 = \frac{EI}{2L} \Rightarrow M_{21} = -\frac{3EI}{2L^2}, M_{23} = \frac{3EI}{2L^2}$$

$$\Phi_1 = \Phi_2 = \frac{3}{2L^2} \cdot \frac{L}{2} = \frac{3}{4L}$$

mjerilo dužina : 1 cm :: 1 m      mjerilo  $\Phi_i$  i  $H$  : 1 cm :: 1,0       $m = 4L$ ,  $H = n = L$   
 očitana vrijednost  $\eta_R(L/2) = -1.6 \text{ cm} \Rightarrow \eta_R(L/2) = \eta_R(L/2) \cdot \frac{n}{m} = -1.6 \frac{L}{4L} = -0.4$

$$R(K) = -160 \cdot -0,4 = 64 \text{ kN}$$

Razlika je u odnosu na analitičku vrijednost ( $R(K) = 65 \text{ kN}$ ) zbog ograničenih mogućnosti očitavanja vrijednosti. Uz  $m = 16L$ , očitana vrijednost bi iznosila  $\eta_R(L/2) = -6.5 \text{ cm}$  i dobili bismo točnu vrijednost.
