STUDIO
ARHING

Studio Arhing / Structural Engineering Office

Founded in 1991. in Zagreb, Croatia

33 years of structural engineering experience:

- Structural design in steelwork, concrete, timber and masonry
- Special structures
- Building performance
- Assessment & renovation
- Refurbishment, re-modelling and renovation of historic and listed structures
- Seismic assessment & rehabilitation
- Foundation design, including deep basement for urban sites

Expertise:

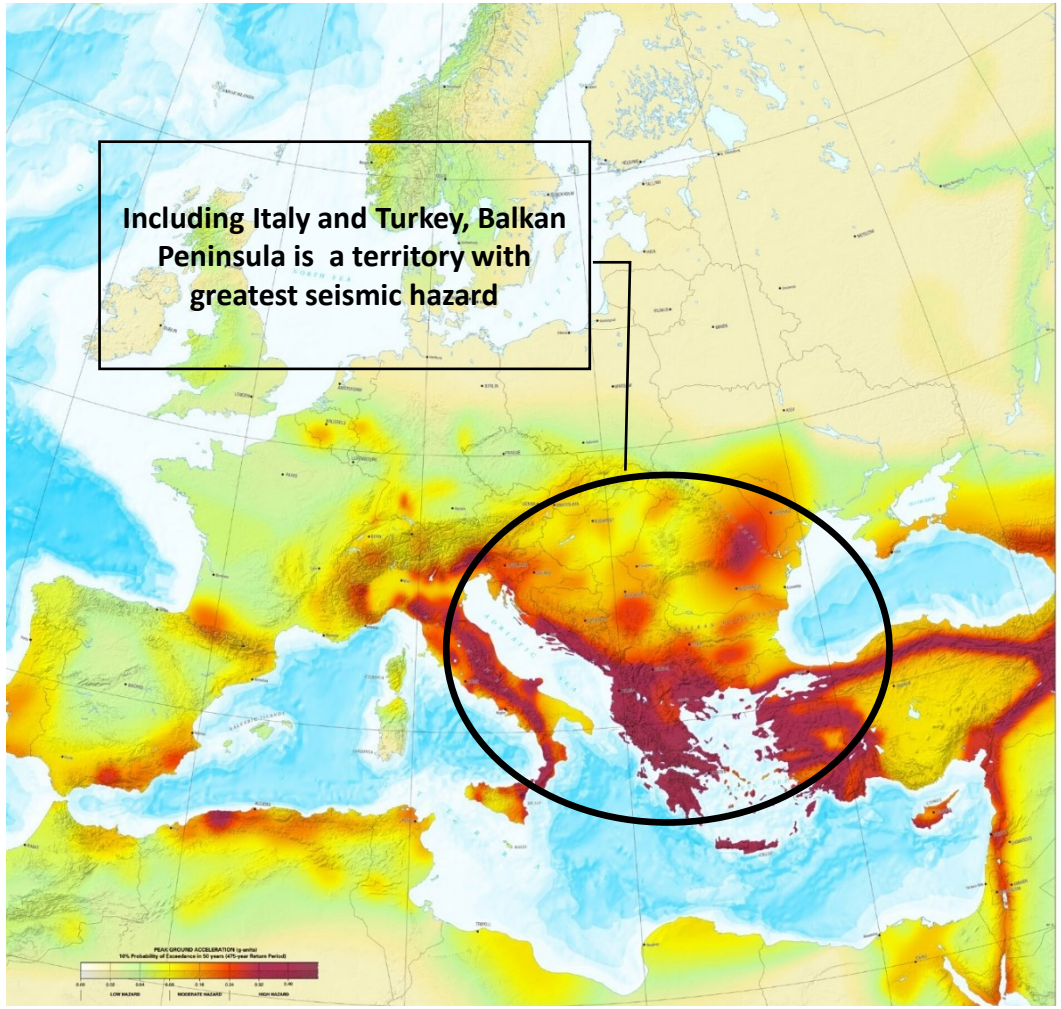
- Building Seismic Assessment Expert / U.S. Department of State
- Research, Documenting and Renovation of Historic Structures / Croatian Ministry of Culture
- Heritage buildings Seismic Consultants / Croatian Centre for Earthquake Engineering CCEE

Content:

1. Introduction – damage to sacral and heritage buildings after the earthquake
2. Urgent measures
3. Documentation and Research / ANAMNESIS - HISTORY
4. Assessment of the condition of the building structure / DIAGNOSIS
5. Technical solutions for repair and reinforcement / THERAPY

2020 Earthquakes

Damage to heritage buildings



Peak Ground Acceleration on Reference (Type A) Bedrock (a_{gR}) with a 10 % probability of being exceeded in 50 years (475 year return period) – LIFE SAFETY for important cities in our region:

ZAGREB	**~ 0.26g – 0.29g**
SKOPJE	**~ 0.24g**

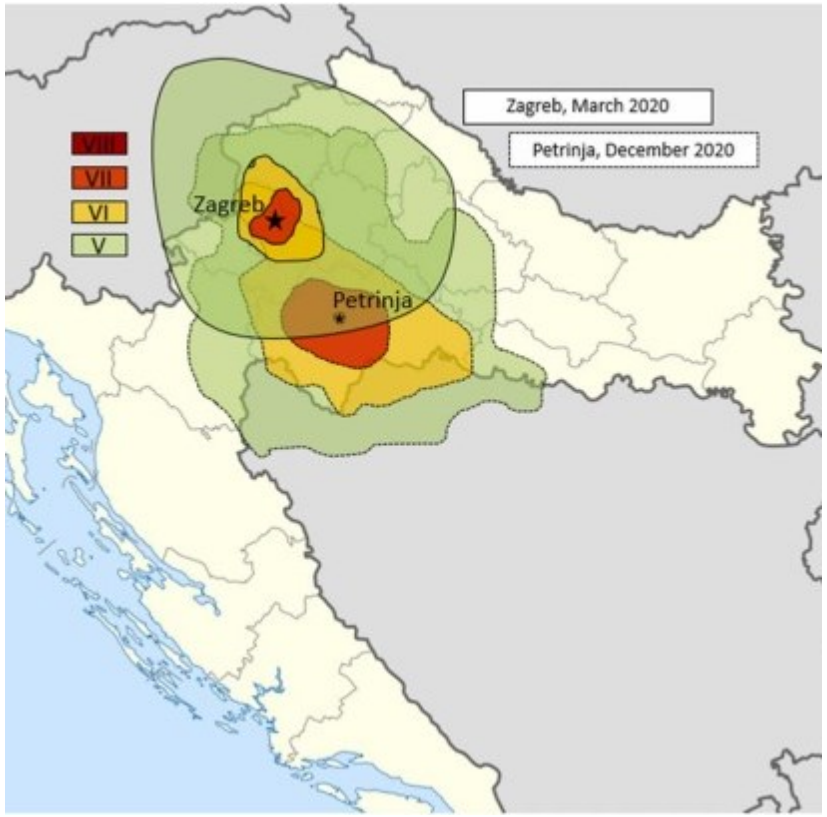
DUBROVNIK	**~ 0.31g**

Damage to heritage buildings



Zagreb M_L = 5,5

Petrinja M_L = 6,3

Tablica. Stupnjevi oštećenja za zidane građevine prema EMS-98 klasifikaciji

Kategorija	Skica	Detaljan opis
I		**Neznatno do blago oštećenje** **- zanemarivo konstruktivno oštećenje** **- blago nekonstruktivno oštećenje** Vrlo tanke pukotine u ponekim zidovima Otpadanje malih komada žbuke Vrlo rijetko otpadanje pojedinačnih odvojenih dijelova zida
II		**Umjereno oštećenje** **- blago konstruktivno oštećenje** **- umjereno nekonstruktivno oštećenje** Pukotine u brojnim zidovima Otpadanje većih komada žbuke Djelomično otkazivanje dimnjaka
III		**Značajno do teško oštećenje** **- umjereno konstruktivno oštećenje** **- teško nekonstruktivno oštećenje** Velike, razvedene pukotine u većini zidova Otpadanje crijepa Otkazivanje dimnjaka u razini krova Otkazivanja pojedinačnih nekonstruktivnih elemenata (pregradni, zabatni zidovi)
IV		**Vrlo teško oštećenje** **- teško konstruktivno oštećenje** **- vrlo teško nekonstruktivno oštećenje** Značajno otkazivanje zidova Djelomično otkazivanje konstrukcija krovova i međukatnih konstrukcija
V		**Otkazivanje** **- vrlo teško konstruktivno oštećenje** Potpuno ili gotovo potpuno rušenje

57 000 damaged buildings

206 damaged sacral buildings

Specific Issues in Structural Assessment / Intervention Approach

- Interdisciplinary approach (wide range of involved competences: engineers, architects, material experts, conservators, restorers, art historians, archaeologists, lab technicians, ...)
- Historical information (sources: owner archives, conservatory department, literature, field research)
- Investigative field research (in-situ and laboratory testing): timber, masonry, steel, concrete, foundation soil / Material and geometric characterisation of the structure
- Structural Analysis / Numerical modelling Identification of potential vulnerabilities -> understanding of structure behaviour
- Intervention Design

ICOMOS CHARTER- PRINCIPLES FOR THE ANALYSIS, CONSERVATION AND STRUCTURAL RESTORATION OF ARCHITECTURAL HERITAGE (2003)

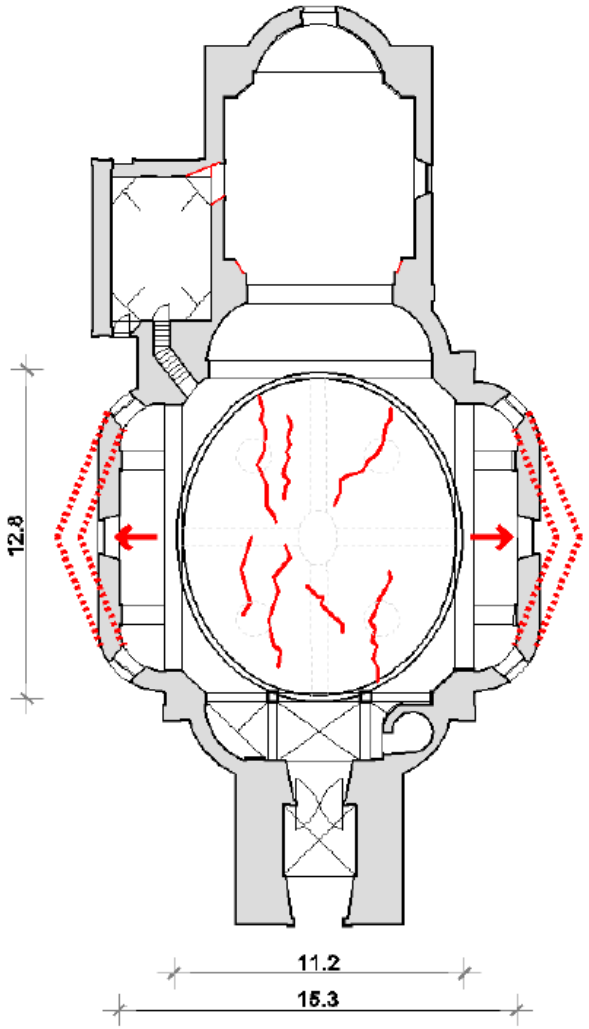
ICOMOS
international council on monuments and sites

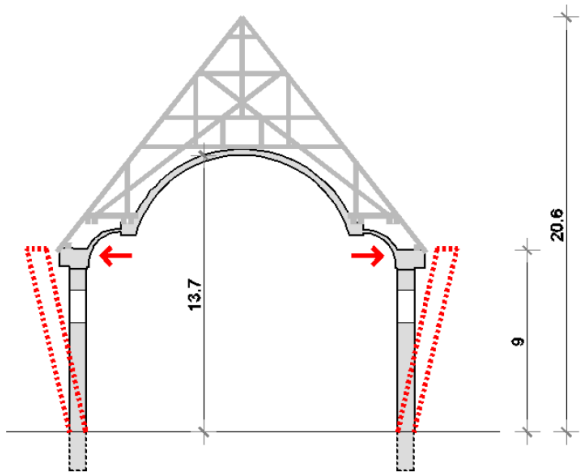
The peculiarity of heritage structures, with their complex history, requires the organisation of studies and proposals in precise steps that are similar to those used in medicine. Anamnesis, diagnosis, therapy and controls, corresponding respectively to the searches for significant data and information, individuation of the causes of damage and decay, choice of the remedial measures and control of the efficiency of the interventions.

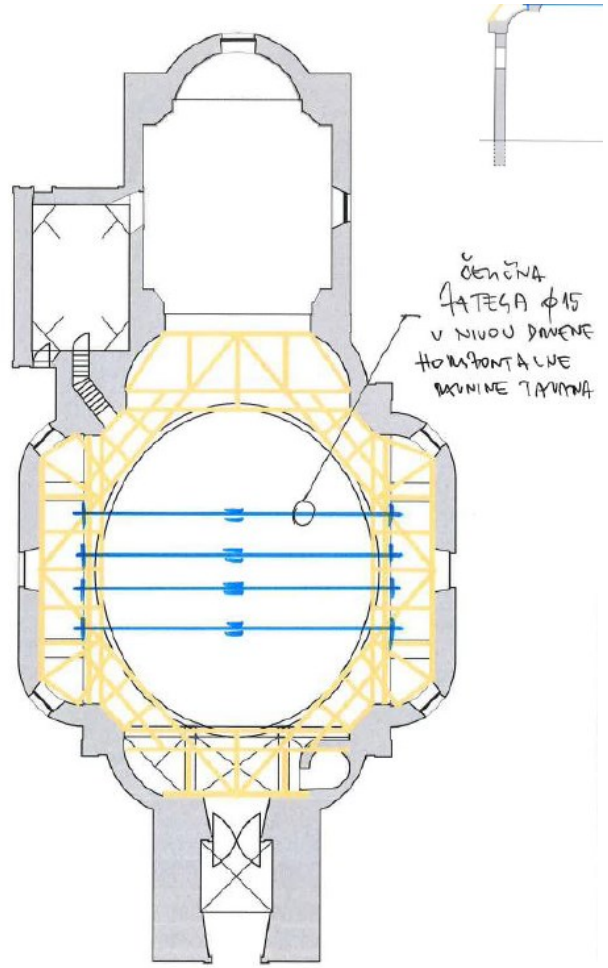
Structural safety (EUROCODE)

Preservation of cultural property

Urgent measures







Urgent measures

S ciljem utvrđivanja veza opeke, dimenzije i vrste opeke, debljine sljubnica i debljine završne obloge, provedeno je otvaranje konstrukcije (sondiranje) na ukupno 15 ispitnih pozicija. Rezultati provedenih sondiranja dani su u nastavku.

2.1 Pozicija Z1 – istražna sondaža

Istražna sondaža Z1 nalazi se u sjevernom stupu katedrale, bušenje je provedeno iz stubišta Svečeničkog doma. Endoskopiranjem utvrđen je sastav i karakteristike stupa te je dodatno provedena klasifikacija zida prema Borriju i sur. Navedena klasifikacija zida uzima u obzir stanje očuvanosti elemenata zida (faktor SM), geometrijska svojstva elemenata zida (faktor SD), oblik elemenata zida (faktor SS), poprečni spoj slojeva kod višeslojnog zida (faktor WC), svojstva horizontalnih (faktor HJ) i vertikalnih (faktor VJ) sljubnica zida te mehanička svojstva morta (faktor MM).

Notes[10]: Test performed with three vertical sensors

Observations[11]: ND

Cut executed by using a gasoline powered ring saw (EXP040)

Employed instrumentation: EXP010, EXP033÷EXP037

Key:

1) type of flat jack used: [C] semicircular; [R] rectangular

2) flat jack dimensions: [LxP] Width by Depth in mm

3) conversion factor relating internal fluid pressure to applied stress

4) ratio of measured area of the flatjack to the average measured area of the slot

5) masonry type (see italian standard NTC2018 for reference, TAB C8.5.I): [PD] irregular stone rubble masonry; [CB] roughly shaped two-layered stone masonry; [PS] coursed stone masonry with proper arrangement; [TI] irregular soft stone masonry; [TR] regular soft stone masonry; [LS] Ashlar fine masonry; [MP] solid brickwork masonry; [MS] hollow brickwork masonry; [MIS] mixed stone/brickwork masonry; [BS] regular concrete blocks masonry

6) period of construction of the building/infrastructure or [NN] unknown

7) use of shims between flat jack and masonry: [Yes/No]

8) ambient conditions [T/RH] at the time of testing

9) "elastic" response limit stress level (stress value above which the stress-strain relationship manifests a visible and properly identifiable stiffness decrease) in N/mm² or [NN] non detectable

10) description of any deviations from the standard method, of all variations, additions or exclusions to the test specification and any anomalies found or [ND] nothing to declare

11) information provided by the applicant or detected by the laboratory concerning documentation and any other form of identification and qualification of the material or [ND] nothing to declare

Chemical Analysis Of Mortar

Dr. Davide Melica
Diagnostica per il Restauro
e la Conservazione

SAMPLE MA.01 SHEET

Sample type : *fragment of brown bedding mortar*

Sampling zone : *-*

Aim of the analysis : *definition of compositional, textural and microstructural properties*

Performed analysis : *optical microscopy with polarized transmitted light*

MACROSCOPIC FEATURES OF THE SAMPLE		
1	Tipology	mortar
2	Dimensional appearance	coarse sand
3	Structural appearance	homogeneous
4	Color	
4.1.	○ whole color	brown
4.2.	○ grains	dark grey
5	Coesion (empiric evaluation)	medium (sample breaks without disgregating)
6	Decay products	not recognizable

Optical microscopy on thin section (petrographic examination)

MICROSCOPIC FEATURES OF THE BINDER		
1	Mineralogical composition	The binding matrix shows a high-order interference colour (hazel-brown) characteristic of calcium carbonate ($CaCO_3$) in the form of calcite; it is therefore attributed to the carbonation process of an aerial lime.
2	Structure	weakly lumpy
3	Texture	micritic ((crystal size <4 μm)
4	Interactions with the aggregate	absent
5	Porosity	
5.1.	○ tipology	pores and few microcracks
5.2.	○ ubication	intergranular (inside the groundmass or at the edge of the hgrains))
5.3.	○ % (by volume)	low (~15%)
5.4.	○ origin	primary (mainly formed during the shrinkage and hardening phases) and secondary (due to degradation processes)

Dr. Davide Melica - Consulenza e Diagnostica per il Restauro e la Conservazione

3

Dr. Davide Melica
Diagnostica per il Restauro
e la Conservazione

MICROSCOPIC FEATURES OF THE AGGREGATE		
1	Size	
1.1.	○ dimensional range (estimated values)	Grain size varies from coarse silt to fine gravel (0.03-3.6 mm) but it mainly falls in the fine sand (0.15-0.25 mm) and in the coarse sand (0.6-0.85 mm) classes – bimodal distribution; it spreads in the different fractions as listed below:

size classes	%
fine gravel (2-4 mm)	5
very coarse sand (1-2 mm)	10
coarse sand (0.5-1 mm)	25
medium sand (0.25-0.5 mm)	15
fine sand (0.125-0.25 mm)	25
very fine sand (0.062-0.125 mm)	10
coarse silt (0.031-0.062 mm)	10

For the reconstruction of the mortar, a sieved aggregate with a composition similar to that described below (point 6) shall be used consisting of:

size classes	%
residue on the sieve 2 mm mesh	5
residue on the sieve 1 mm mesh	10
residue on the sieve 0.5 mm mesh	25
residue on the sieve 0.25 mm mesh	15
residue on the sieve 0.125 mm mesh	25
residue on the sieve 0.062 mm mesh	10
residue on the sieve 0.031 mm mesh	10

1.2.	○ sorting	high
2	Shape (rounding and sphericity)	rounding: sub-rounded or rounded; sphericity: from medium or low
3	Surface morphology	smooth or slowly faceted
4	Orientation	absent
5	Distribution	homogeneous

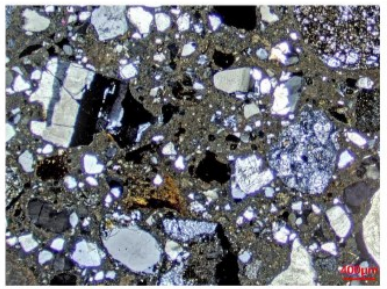
Dr. Davide Melica
Diagnostica per il Restauro
e la Conservazione

6	Composition (% by volume) (estimated values)	Aggregate has a silicatic composition; in order of decreasing abundance it spreads as listed below:

rocks or mineral types	%
• fragments of metamorphic rocks (gneisses, quartzites) consisting of quartz associated with feldspars and/or micas; each mineralogical component also appears in isolated single crystals in the binding matrix	50
• flint and flinty marls	45
• particles of clay and iron hydroxides	5
• fragments of sedimentary rocks (sparitic limestone with microfossils)	tracce

7	Admixtures	absent
8	Binder/Aggregate Ratio (by volume)	= 1:2.5

CONCLUSIONS		
1	Mixture characterization	It is a mortar consisting of carbonated aerial lime and silicatic river sand. The binding matrix has a weakly lumpy structure. The sandy aggregate is composed of metamorphic lithotypes (quartzites, gneisses) and flint; it also contains a fair amount of clay and iron hydroxides indicative of poor washing. The size of the clasts has a bimodal distribution; they fall predominantly in the fine sand class (0.15-0.25 mm) and in the coarse sand class (0.6-0.85 mm); some of them exceed 3.5 mm. The binder/aggregate ratio is 1:2.5 by volume. i
2	Secondary processes and decay products	No evidence of degradation at the expense of the binder matrix or aggregate is observed.



sample MA.01: thin section microphotograph (transmitted light, X polars).

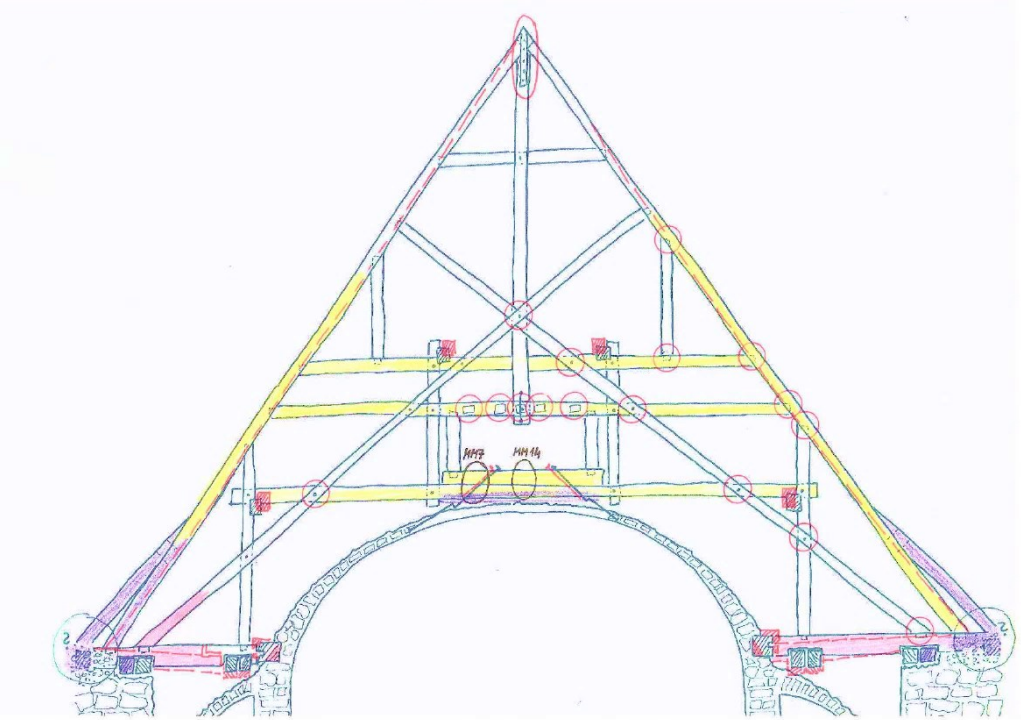
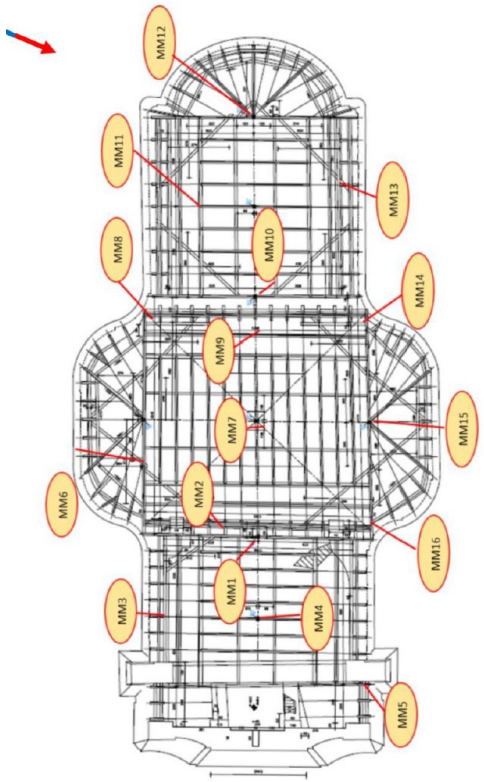
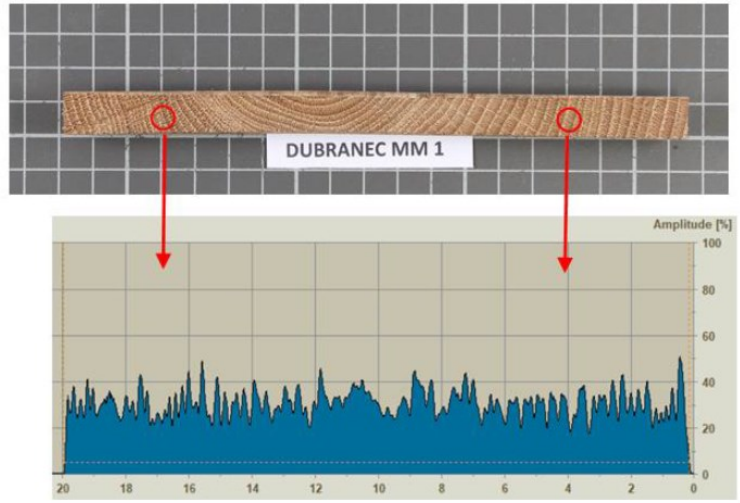
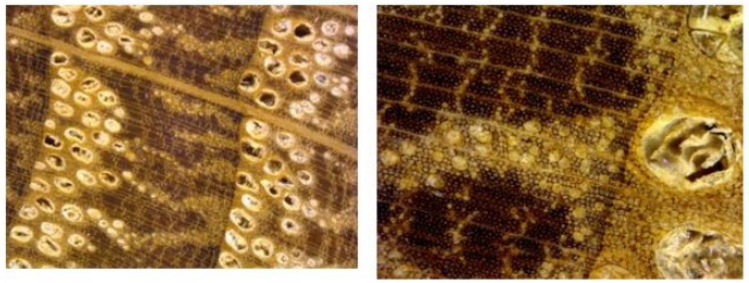
Timber Assessment







Slika 12 a) i b). Mjerno mjesto MM 1, vezna greda do tornja, izvrtak 12,5 mm. Potpuno zdrav i kompaktan presjek pokazuje ravnomjeran raspored i gustoću godova (gore, slika a) i primjeren otpor prodiranju rezistografske igle (dijagram).



Slika 13 a) i b). Mikrografije pokazuju ravnomjeran, višeredan raspored pora u ranom drvu i vrlo gusto kasno drvo s radijalnim nizovima uskih pora (10x, lijevo), te velike pore ranog drva zapunjene tilama, kao i zdrav paratrahealni parenhim kako u ranom, tako i kasnom drvu (desno, 50x)

Force Measurement In Steel Ties

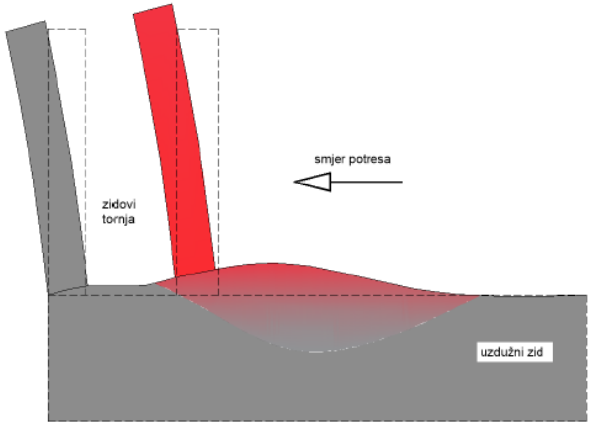
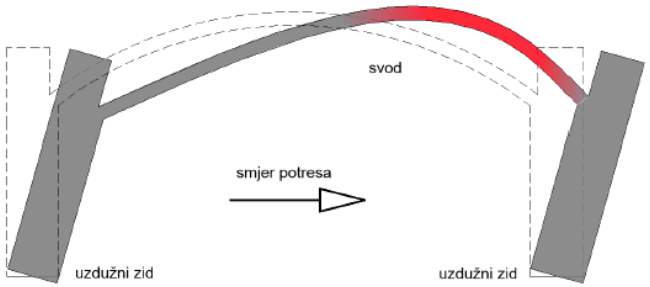
Slika 5-26 Prikaz oštećenja - Push-over u smjeru +x

Seismic Analysis

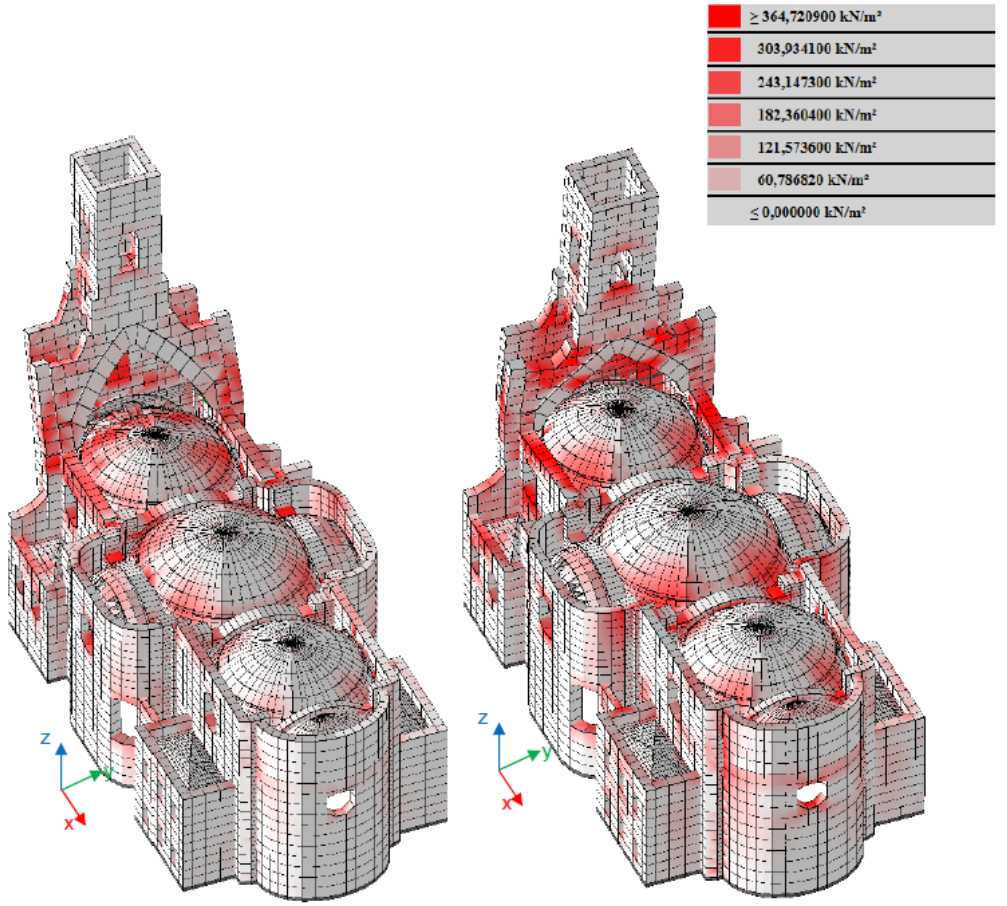


Slika 5-33 Vlačna zona zida uslijed djelovanja potresa na toranj

Pri djelovanju potresa u poprečnom smjeru (y-smjer) uzdužni zidovi crkve savijaju se van svoje ravnine uzrokujući deformaciju svodova uslijed koje se javljaju vlačna naprezanja.

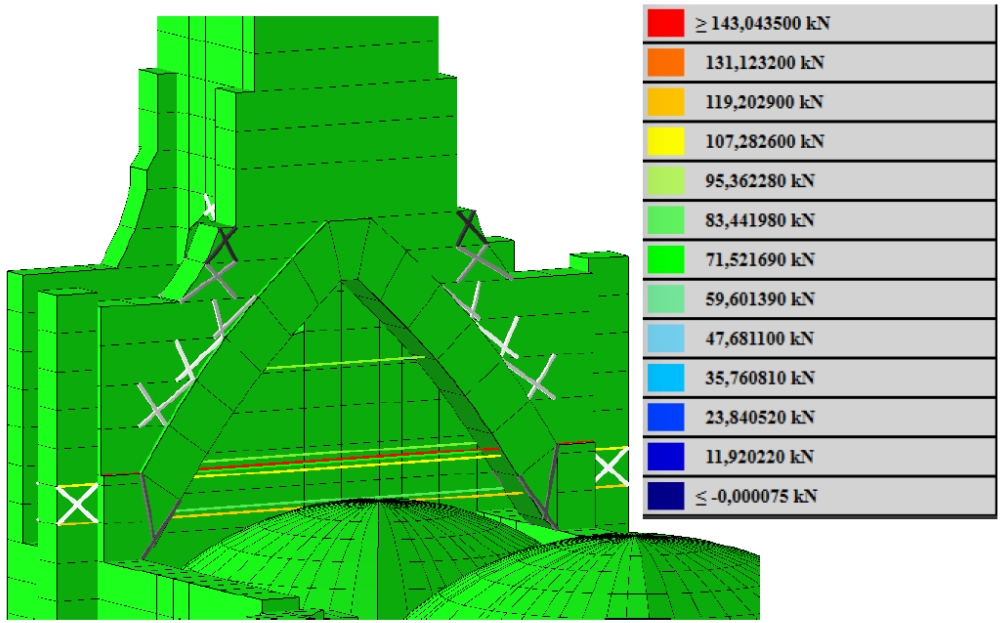


Slika 5-34 Vlačna zona svoda uslijed potresa

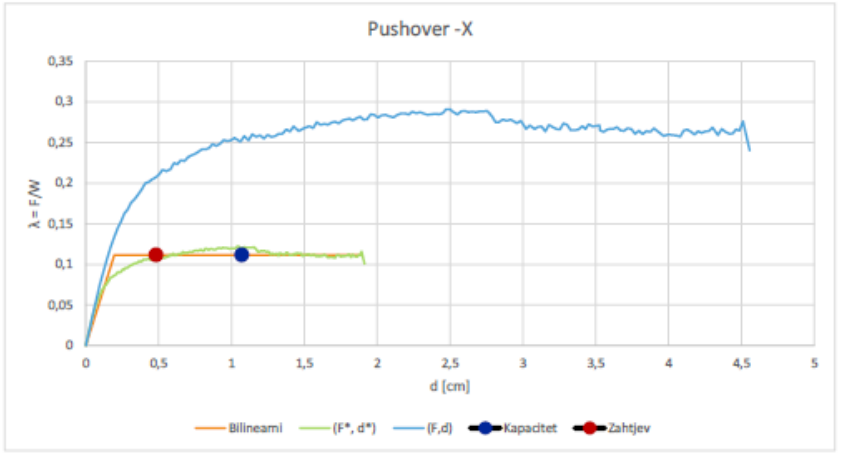


Slika 5-35 Prikaz vlačnih naprezanja - Push-over u smjeru +x i – x

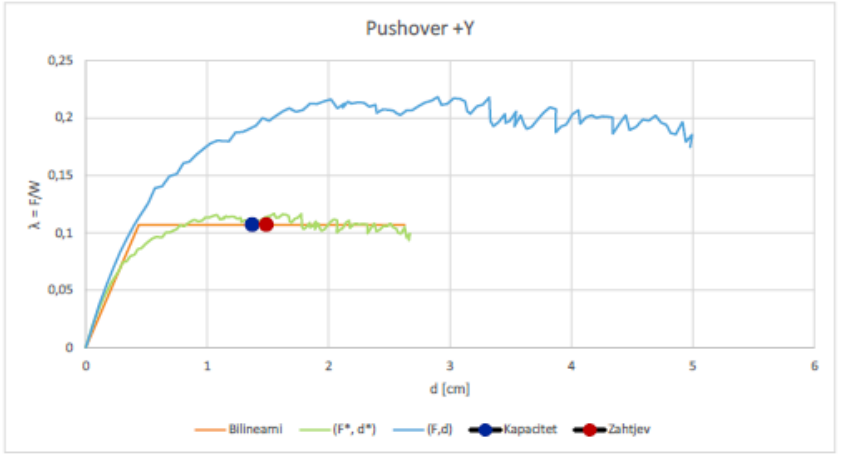
Seismic Analysis



Slika 5-68 Uzdužna sila u zategama – potresno opterećenje



Slika 5-60 Push-over -X; procjena seizmičke ranjivosti



Slika 5-61 Push-over +Y; procjena seizmičke ranjivosti

Seismic Analysis

Procjenom seizmičke ranjivosti katedrale, određene su otpornosti tornja i svodova na potrese povratnih perioda 225 godina, 475 godina i 2475 godina. U tablici ispod prikazane su pojedine otpornosti izražene u postocima koji su dobiveni usporedbom kapaciteta i zahtjeva konstrukcije.

Tablica 5-10 Rekapitulacija pushover analize za sva granična stanja

	Mjerodavna analiza	Granično stanje ograničenog oštećenja – PP 225 godina	Granično stanje značajnog oštećenja – PP 475 godina	Granično stanje blizu rušenja – PP 2475 godina
Toranj	Push-over +x	64,93%	62,76%	60,90%
Svodovi	Push-over -y	40,04%	92,31%	95,65%
Katedrala	Push-over +x	40,04%	62,76%	60,90%

Potresna otpornost katedrale iznosi **40,04%** zahtijevane otpornosti prema aktualnim normama. Kritični dijelovi katedrale su toranj za smjer od zapada prema istoku te svodovi za smjer sjever-jug.
